

A heatmap visualization of the correlation matrix for 100 variables. The top and left sides of the plot feature hierarchical clustering dendrograms. The main body of the plot is a square heatmap where each cell's color represents the correlation coefficient between a pair of variables. The color scale ranges from blue (low or negative correlation) to yellow (moderate correlation) to red (high positive correlation). A prominent red diagonal line runs from the top-left to the bottom-right, indicating a correlation of 1.0 for all self-comparisons. Several off-diagonal red squares are visible, indicating strong positive correlations between specific groups of variables.
